**UNIT -3**  
**The Relational Data Model and Relational Database**

**Relational Model Concepts**

The relational Model of Data is based on the concept of a Relation. A Relation is a mathematical concept based on the ideas of sets. The strength of the relational approach to data management comes from the formal foundation provided by the theory of relations. The model was first proposed by Dr. E.F. Codd of IBM in 1970 in the following paper: "A Relational Model for Large Shared Data Banks," Communications of the ACM, June 1970.

**Informal Definitions**

**RELATION:**

A Relation is table of values. A relation may be thought of as a set of rows. A relation may alternately be thought of as a set of columns. Each row represents a fact that corresponds to a real-world entity or relationship. Each row has a value of an item or set of items that uniquely identifies that row in the table. Sometimes row-ids or sequential numbers are assigned to identify the rows in the table. Each column typically is called by its column name or column header or attribute name.

**Formal definitions**

A **Relation** may be defined in multiple ways. The **Schema** of a Relation:  $R(A_1, A_2, \dots, A_n)$  Relation schema  $R$  is defined over **attributes**  $A_1, A_2, \dots, A_n$ .

**For Example -**

CUSTOMER (Cust-id, Cust-name, Address, Phone#)

Here, CUSTOMER is a relation defined over the four attributes Cust-id, Cust-name, Address, Phone#, each of which has a **domain** or a set of valid values. For example, the domain of Cust-id is 6 digit numbers.
